

The Perigon

MIAMI, UNITED STATES | 2021 -

The Perigon is a large residential complex comprising beachfront residences designed by architects OMA at 5333 Collins Avenue, Miami.

We were asked to design the the project's landscaped gardens, which will reflect the rich diversity of Florida's flora in a sequence of garden rooms that connect with the Perigon's elegant interiors. The gardens will offer fine views of the ocean and are accompanied by a linear water feature, that mirror's the buildings curved and angular form and are filled with aquatic plants and the sound of water.

The Planting concept includes salt tolerant plants and trees typical of the dune protect less resilient plants found in Florida's interior, whilst the garden layout around the Perigon has four character areas; the dune terraces that face east towards the Atlantic Ocean; the water garden that is placed alongside the buildings south elevation; the shade garden that connects the entrance to the club house and the entrance hillside that looks across Collins Avenue to the lagoon. Here, the north shade and south sun gardens introduce as diverse a range of plants as can be achieved in the marine climate, to create a lushly planted sequence of intimate terraces that interact with the buildings interior.

The clubhouse terrace looks across an elegant rectangular swimming pool, whilst cabbana's float in a lily pond and divide the planted areas below the building to enclose intimate sunrise terraces. The mix of curved and rectilinear planters reflect the geometry of the building on the ground.

On Collins Avenue we have Royal Palms interlaced with silver buttonwood trees provide shade on the street and announce the buildings entrance.
